

Assistance with e-health and epidemiological surveillance projects

Do you wish to set up an innovative e-health or epidemiological surveillance service?

MEDES is a “**laboratory of innovation**” with more than 10 years [JK1] experience in developing and deploying e-health projects, particularly regarding satellite-based services, and can help you throughout all the phases of your project.

In particular, MEDES can provide:

Support with specifications and assessment

Do you wish to develop and assess an innovative e-health service?

MEDES can:

- help you draw up the specifications,***
- help you perform the clinical assessment using its own clinical services***

MEDES has also acquired specific competence (and has the necessary tools) for developing software applications for the collection and secure management of data, and for the personalised monitoring of patients.

A data-collection application

Do you need to develop a data-collection application?

MEDES can propose:

- support in developing the application, from the specification stage to the information system***

- assistance in the use of the “IMOGENE” application editor, to facilitate the development of your application, with:

> training in how to use it

> technical support for your teams for their initial developments

To see a more detailed description of IMOGENE, [click here](#).

A customised monitoring application

Customised personal monitoring is a very strong trend in medical practice, but requires the use of information systems close to the patient. MEDES is fully aware of these trends and has undertaken the development of a platform for personal monitoring. This platform, based on standard market technologies and free of all copyright, is fully transferable.

To see a detailed description of the monitoring application, [click here](#).

For example, if you wish to:

- * develop an integrated personal assistant the patient can use to monitor him or herself, or services for health education or therapeutic education or self-monitoring by the patient,
- * integrate your medical device into an e-health system,
- * collect and exchange data between heterogeneous information systems,

MEDES can:

- study, together with you, conditions for enabling you to use its system or for joint collaboration, in order to speed up development and reduce your costs.
